# Part 1: Introduction

Organizer Documents

You can also drag documents from the Finder directly into the Organizer where a *copy* of the document will be embedded in your project for viewing and editing within the Curio environment.

Note if you hold the Command key while dragging in a file then the original will be *moved* into your project. If you hold the Option key then an *alias* to the original will be created.

If an RTF, RTFD, or plain text document then Curio will display a text editor for editing. Image files will be displayed in a viewer. PDF files in a PDF viewer with support for annotations. Web links will be displayed in a WebView.

All other document types will be displayed using a Quick Look viewer which will pull in the appropriate plugin as necessary. For instance, Numbers and Pages files are displayed so that you can easily browse their contents directly within Curio.

Changes made to any editable text documents will be saved automatically when you switch to another item in the Organizer or when you close the project. Renaming the title in the Organizer will rename the underlying file as well, if embedded.

The Organizer is simply acting as a binder to collect these documents in your project. These items are not printed, exported, or published with your project's idea spaces. However, you can right-click on the document item in the Organizer to open, print, or reveal the file in the Finder using the context menu.
